## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-16 are rejected under 35 U.S.C. 103 (a) as being unpatentable over Makoto et al, Pat. No. JP 2003-063101 (cited by Applicant) in view of Shin, US. Pat. No. 5,886,425.

3. Claims 1-16, Makoto teaches a power supply device, comprising: a main power supply circuit [*main power supply 401*] for supplying power to a main control section of a main apparatus [*main CPU 202*], the main apparatus including an interface section for communicating with an external device, the interface section having a signal detection circuit for detecting an external signal; an auxiliary power supply circuit for supplying power to the signal detection circuit [*see Fig. 4*]; and a power control section configured to control the main power supply circuit and the auxiliary power supply circuit respectively [*CPU 213*], the power control section being configured to turn the main power supply circuit off and turn the auxiliary power supply circuit on when the main apparatus is in power saving mode, and to restart the main power supply circuit upon the detection of external signal by the signal detection circuit [*see Fig. 4 and abstract*].

Makoto fails to teach the auxiliary power supply circuit being connected to a commercial power supply.

Art Unit: 2116

Shin teaches an electronic product [*element 8 of Fig. 2*] with standby power supply [*element 7 of Fig. 2*]. The standby power supply circuit being connected to a commercial power supply [*see the configuration of Fig. 2*].

It would have been obvious to a person of ordinary skill in the art to modify Makoto to include Shin's system, because it prevents unnecessary power consumption [*see Shin, col. 1, lines 45-51*].
